

Usage

Default calculations are based upon a duty cycle of 4 hours per day (including the first hour (lamp) or first half hour (laser) of peak power usage after turning on the projector), 190 days per year for a period of 5 years using, by default, the normal - on mode and with the assumption that the projector is being turned on once a day. If the eco - on mode is selected for the calculation scenario, the calculations are based upon the same assumptions as above but made in eco - on mode. Watts and values will vary by country.

Sources are either UK government or European instances using EEA (European Environmental Agency).
